FRINK CORNICE REFLECTORS

NATIONAL CITY BANK

SHOWING the Frink System applied to marble cornice; reflector with No. 16 gauge cold-drawn bronze frame running continuously around the inner side of main screen cornice, with switch arrangement to light each cage separately. When figuring the cost, consider that our equipment includes part of the work usually furnished by the screen manufacturer, the electrical contractor and fixture house. Obtain estimates from the screen manufacturer for the extra moulding necessary to form a finish to the inner side of the cornice, the cost of cutting the bronze or marble for bracket outlets, and an estimate from the electrical contractor on the extra work required for a bracket equipment, such as running his conduit and providing junction boxes at each bracket outlet, add the above expense to the cost of the brackets and shades, and deduct the whole amount from the reflector estimate, and you will find the difference, if any, is very slight, and not to be considered when compared with the symmetrical and highly efficient equipment which is the result of the use of our system.

Copyright 1921 by I. P. Frink, Inc.

GENERAL · BANK · LIGHTING

PROBABLY no class of interior lighting requires more precise knowledge and ability to secure desired results, than does the modern banking room. This is largely due to the need for separating the public from the working space by means of enclosing partitions, or screens, forming thereby cages, within which the work performed is of a most exacting nature and necessitating thoroughly good lighting.

The banking room is then first of all a place of business, and as such its lighting must be both effective and conducive to efficiency. But the bank is also, as a rule, a structure of monumental design and proportions. It must hence be illuminated in a manner to harmonize these two conditions or requirements.

By means of the Frink system each working surface is given careful study and a reflector provided therefor which not only amply lights the surface, but does this in a manner which eliminates all objectionably bright surfaces within the normal field of vision. The result is illumination conducive to maximum efficiency with a minimum of eyestrain or fatigue; a truly desirable result.

Frink lighting systems being designed to fulfil the requirements above outlined are sufficiently flexible to be readily adapted to any form of structure and to any architectural motif. It is the one system which makes possible the effective lighting of banking rooms in an entirely harmonious manner.

The importance of proper lighting cannot be overestimated. This is particularly true of the bank, for aside from its value as a clerical efficiency producer, proper illumination correctly applied has an aesthetic significance and value that is a direct asset to the institution.

YOU WILL PROFIT BY KEEPING THIS IN
MIND WHEN CONSIDERING THE LIGHTING
OF YOUR BANK WHETHER OLD OR NEW

FRINK CORNICE REFLECTORS

GUARANTY TRUST COMPANY

New York

This is one of the finest examples of bank architecture in the country.

For illuminating the counters 223 feet of screen reflector with heavy bronze frame and diffusing glass doors are used. The desks are lighted by 226 desk reflectors made of No. 16 gauge cold-drawn bronze, square standards and cast bases.

This system of lighting was decided upon by the architects and engineers of the bank after a careful consideration of all types of lighting methods that were offered.

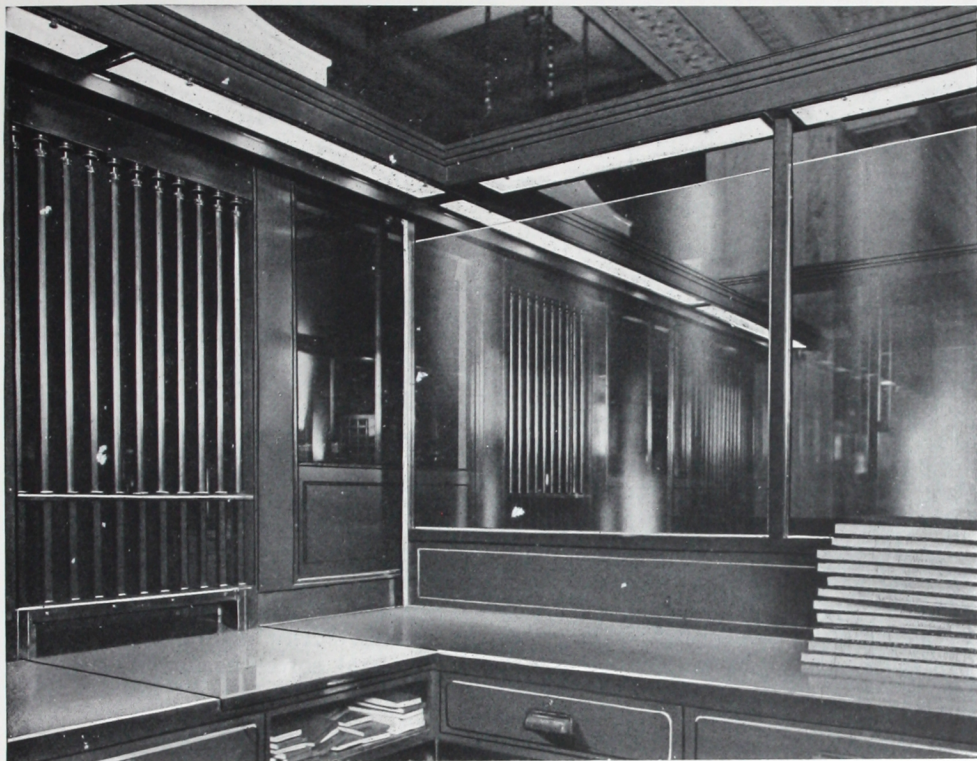

In the construction of this building only the best materials were used, and it is, therefore, with some pride that we exhibit this installation as indicative of the possibilities of the Frink System.

We have been widely commended on this work by the Bank officials, patrons and visitors.

After using this installation seven years in their Broadway building, we were awarded the contract for the screen and desk reflector equipment for their Fifth Avenue and 43rd Street branch, also for the new branch at Fifth Avenue and 44th Street. A testimonial for quality and service.

FOR DESIGNS SEE PAGES 6 AND 7

FRINK CORNICE REFLECTORS

FIRST NATIONAL BANK

Denver, Colorado

An example of the Frink Combination Cornice and Light Diffusing Reflector System as originally adopted for this institution.

The reflector on main screen cornice illuminates the desks on the inner side of the screen and those reflectors over partitions illuminate desks on both sides and trim off the partitions with a cornice effect. See pages 16 and 17 for typical layout.

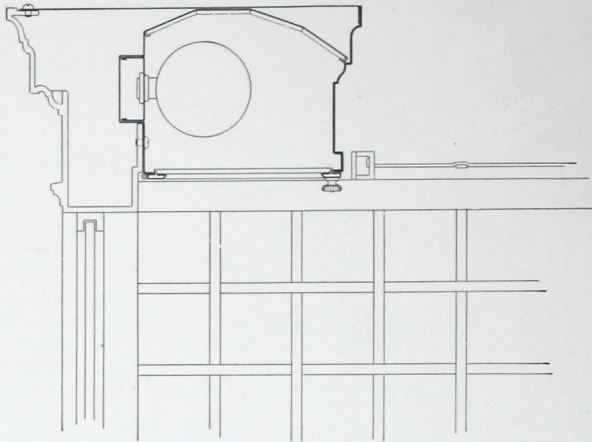

Each cage in this installation is equally and effectively illuminated over the entire cage area with diffused light.

Installations of this character may be had in cold drawn bronze or steel formed to any cornice or molding detail desired.

We offer the services of our Engineering Department and the experience gained by thousands of installations throughout the United States and Canada.

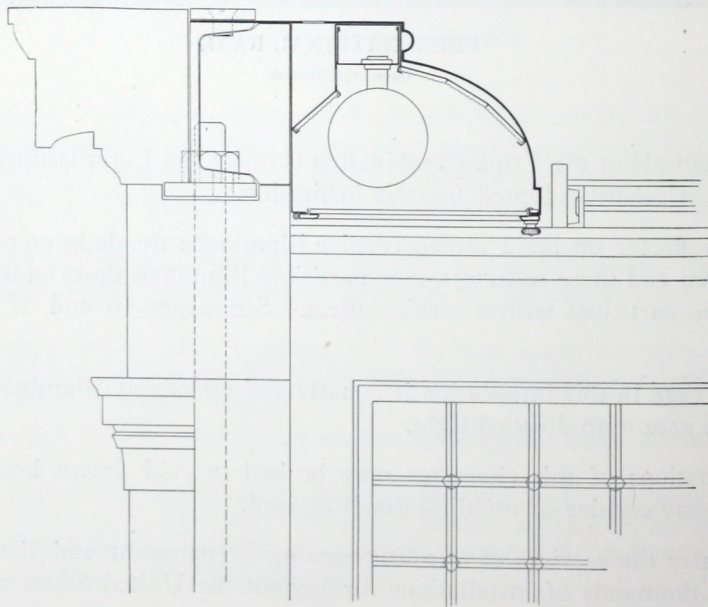

FOR DESIGNS SEE PAGES 6 AND 7

FRINK CORNICE REFLECTORS

No. 18507. $\frac{1}{4}$ FULL SIZE

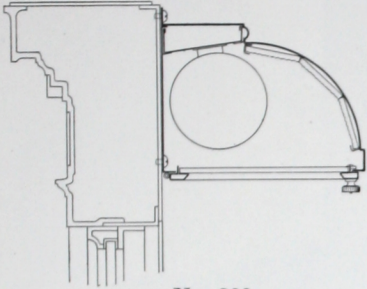

Reflectors are a part of and form a finish to inner side of main screen cornice. See description page 2. Can be made special to suit any cornice and arranged for Frink Linolite, Edison base bulb or tubular lamps. Any of the types shown on page 7 can also be constructed as a part of the bank screen cornice.

FRINK CORNICE REFLECTORS

The many beautiful banking rooms in all sections now lighted by the Frink System of continuous trough reflectors are the best possible indication of the adaptability of our system to this type of room.

In fact, we do not hesitate to say that, all things considered, the Frink System of Concealed Lighting by Means of Continuous Trough Reflectors is Pre-eminently the Bank Light.

Regardless of architectural motif, all Banking Rooms of necessity incorporate as an essential feature a counter screen separating the public from the working spaces. This essential characteristic is availed of in the design and application of Our System of lighting, and is, in fact, the feature which makes the system distinctive of the Banking Room.

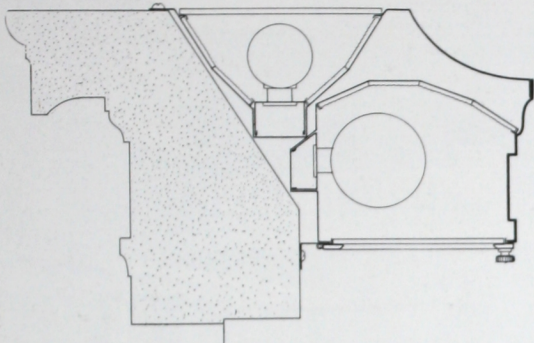

Visible light sources being entirely eliminated, the premises assume a freer and more monumental aspect, and it is ordinarily difficult for the uninitiated to discern "where the light is coming from."

Naturally, a system of this kind cannot consist of stock units or designs, since unless it properly blends with surrounding architectural features the application will not be successful.

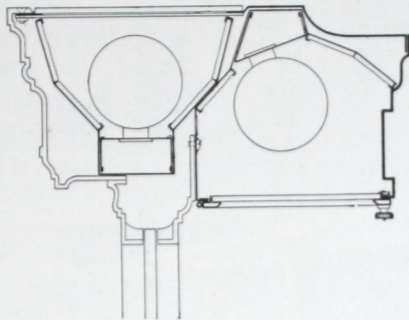

The illustration above gives an excellent idea as to the effect obtained while the scale drawings show more intimately the typical contours and the application of these to the screen cornices. The services of our Engineering Department in applying this idea are yours for the asking, and you are urged to avail yourself thereof. Definite recommendations will be made on receipt of preliminary plans and elevations of rooms under consideration.

Combination cornice, reflector and upward diffuser. With this method, the reflector is part of and forms a finish to inner side of cornice. The lower reflector lights the counter while the upper reflector distributes the light over the ceiling for general illumination. Made specially to suit any cornice.

CUT SHOWING ILLUMINATION THROUGH GLASS CEILING AND
FROM REFLECTORS IN COVES

The natural lighting of the Banking Room by means of glass ceiling suspended beneath an outer skylight is a practice much favored where building location and design will permit.

This idea, however, is scarcely complete if measures are not also taken to provide for the artificial lighting in the same general direction, *i. e.*, through the glass ceiling. If this be not done, what is a beautiful ornamental panel in daylight—becomes after nightfall an unsightly black hole in the ceiling.

The result of such treatment if carefully handled, is indeed well worth the time and effort expended since by means of this scheme of illumination the general effect is the same under both the natural and artificial light.

There are many details entering into the solution of this problem such as the relation of the outer skylight, the location, area and type of glass for the ceiling sash, which must be carefully examined into if satisfaction is to result.

We have in our long practice solved many such problems, and will gladly place at the disposal of architects and engineers the facilities and experience of our Engineering Department.

Definite recommendations will be made where desired. These to involve both the glass and the artificial lighting equipment.

Concealed Lighting from Coves

TYPICAL SECTIONS

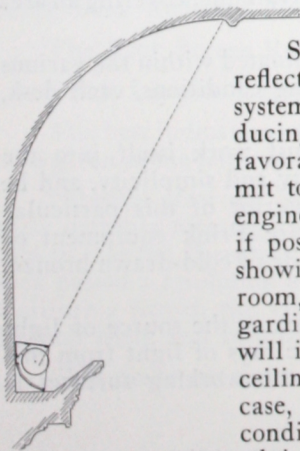

Fig. C

Showing method of illuminating rooms by reflectors installed in coves or cornices. This system offers excellent opportunities for producing beautiful effects where conditions are favorable. It is advisable when time will permit to submit propositions of this kind to the engineering department for advice. Send plans, if possible, or better still preliminary sketches showing the architect's idea of the design of the room, from which we can make suggestions regarding construction and position of cove that will insure satisfactory results. An ornamental ceiling is preferable to a plain one. In any case, a reflector specially designed to suit the conditions should be used. We offer expert advice.

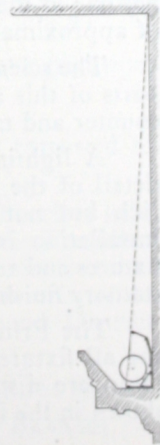

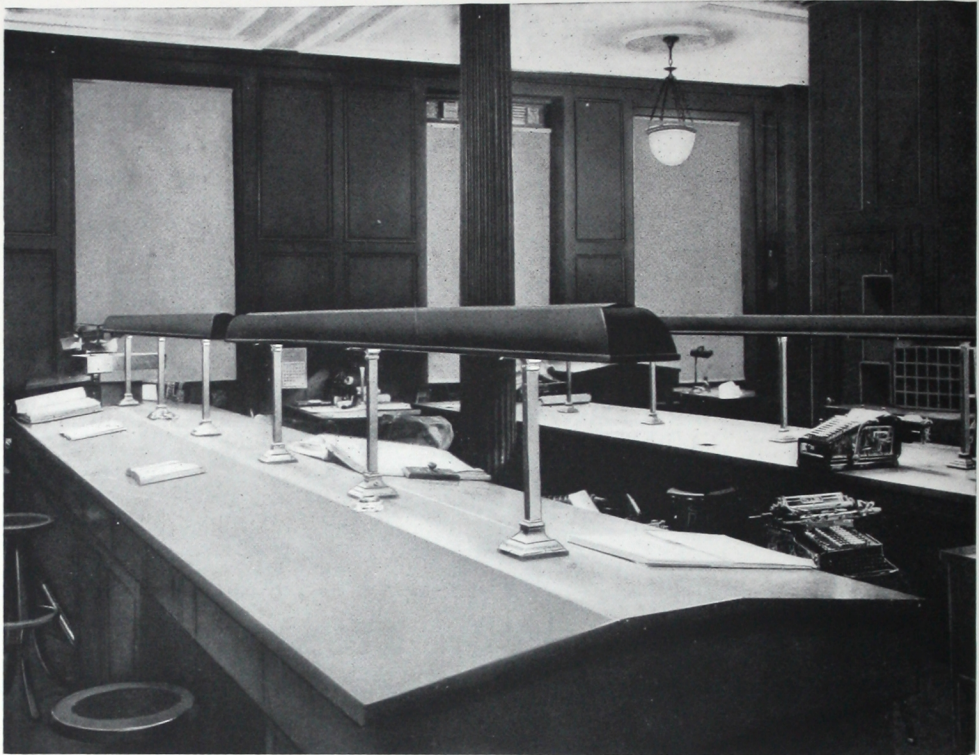

Fig. D

FRINK DESK REFLECTORS

MECHANICS AND METALS NATIONAL BANK
of the City of New York

This bank is one of the leading financial institutions of the United States and has one of the largest and best equipped banking rooms available, covering an area of approximately 10,500 square feet.

The scientific illumination of the working surfaces situated within the various parts of this area was designed to meet the most exacting conditions, each desk, counter and table receiving individual treatment.

A lighting system for a bank of this character must work itself into the detail of the equipment and not detract from the dignity and simplicity, and be rich but not gaudy. The prevailing finish of the interior of this particular installation is Old English Oak; consequently the entire Frink equipment of fixtures and reflectors for the bank screens, desks, etc., made of cold-drawn bronze, statuary finish.

The Frink Linolite 25 watt Mazda lamp was chosen as the source of light for all fixtures. The very efficient manner in which the rays of light from this lamp are distributed and directed without glare over the working surfaces is shown in the illustration.

FOR DESIGNS SEE PAGES 14, 15, 20 AND 21

FRINK DESK REFLECTORS

MISSION BRANCH BANK OF THE GERMAN SAVINGS AND LOAN SOCIETY
San Francisco, Cal.

The general illumination of this building is accomplished by the Frink Semi-Indirect Electrolites. For the localized lighting over work-tables and check desks, Desk Reflector No. 18521 was used.

The Bank Screen Reflector molding is carried around each counter partition. Frink Linolite Lamps are used in all reflectors.

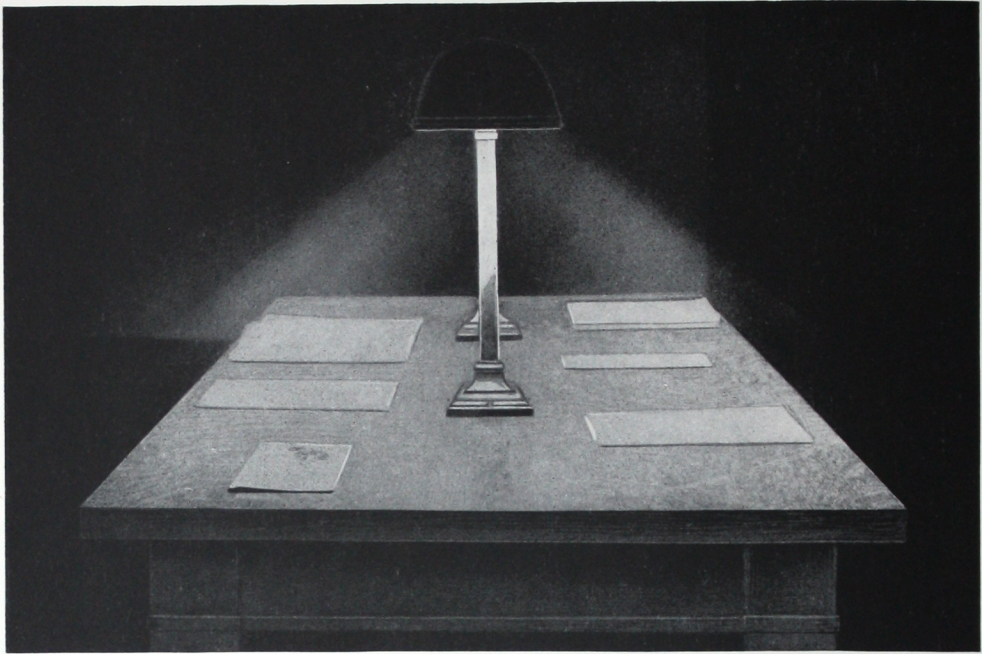

The best indication of the company's satisfaction with the work entrusted to us is given in the letter quoted below.

"Shortly after the Mission Branch was finished the Board of Directors held their monthly meeting in the new bank at night, and the next day the President told us that the Directors were so well pleased with our system of illumination that they passed a resolution authorizing him to have us go over their main bank on California Street, the Haight Street Branch Bank and the Richmond District Branch Bank and improve their lighting."

"We made our recommendation and secured the order for these three banks."
(Signed) MANAGER OF SAN FRANCISCO BRANCH.

SPECIAL DESIGNS FURNISHED ON REQUEST

Description

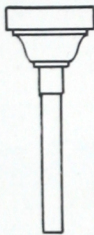

Frink Polaralite Signs consist of a heavy sheet of plate glass into which the lettering or design is deeply sandblasted. An entirely new departure in construction, so different from ordinary signs that it at once attracts attention by its striking and forceful appeal.

The source of illumination is entirely hidden. The light enters the plate through the edge. The plate appears dead except where the blasting occurs, giving a surprisingly beautiful and original effect.

It is artistic, economical and durable; there is nothing to deteriorate or wear out. For all places where an ornate and effective sign is demanded, such as Banks, Libraries, Hotels, Stores and Public Buildings generally, the Polaralite Sign has no equal.

The examples shown are merely suggestions; there is practically no limit to the variety of designs which can be carried out in these signs. We shall be glad to submit sketches and full information on request and co-operate in carrying out the ideas of any prospective buyer.

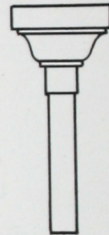

FRINK POLARALITE SIGNS ARE PROTECTED BY U. S. PATENTS ISSUED SEPT. 25, 1906—

FRINK LINOLITE LAMPS

Polaralite Sign Over Wicket

Letters blasted in glass. Frink Linolite lamp concealed in cornice of counter screen over edge of glass. No apparent light source. Producing a striking and unique effect.

**Frink
Mazda**

**Linolite
Lamps**

The *Frink Linolite Lamp* referred to in the foregoing pages has many advantages over the standard screw base tubular lamp commonly used. It consists of a glass tube one inch in diameter and eleven and seven thirty-second inches long. Special Sockets of extremely simple design are provided for the lamp which has a single contact at each end. The filament extends the entire length of the tube—through the center. When placed end to end “Frink Linolite” forms a continuous “line of light.”

The *Frink Linolite Lamp* when used with properly designed reflectors permits perfect control of the light. The filament being a line source of light paralleling the panels of the reflector enables us to confine the light to certain areas or distribute it with equal intensity over a definite surface.

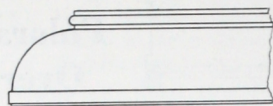

The fine quality Mazda filament is terminated in the end caps forming the contacts. Spring supports are provided within the tube to retain the filament in a central position and prevent injurious sagging. The glass area of the lamp is 31 square inches, nearly twice that of the ordinary tubular lamp and about 20 per cent. more than the usual bulb lamps of equal candle-power. This additional area reduces the effects of natural deposits and enhances the useful life of the lamp.

The special sockets for use with this lamp are of one piece porcelain and involve only one movable part. No live parts of either lamp or socket are exposed to endanger accidental contact or possible short circuits. This socket is smaller than the lamp diameter, and in this respect has an advantage possessed by no other similar device. This permits the designing of efficient reflectors of smaller size than is possible with the ordinary tubular lamp with screw base.

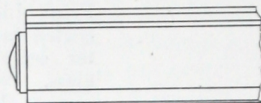

Frink Linolite Lamps are made in three sizes: 25 watt—20 C-P and 35 watt—28 C-P series burning; 25 watt—20 C-P and 40 watt—30 C-P multiple burning. The series lamps operate four in series and are made for 25 to 32 volts for operation on circuits from 100 to 128 volts. The multiple lamp is made for various voltages between 105 and 130. The average useful life of all Frink Linolite lamps is well over one thousand hours.
